Dear Hiring Team,

I would like to apply for the Software Engineer / Business Systems (Python AI) position in London.

My background combines a PhD in High-Energy Physics with more than six years of experience in machine learning, scientific computing, large-scale data analysis, and applied AI engineering. I have worked on complex technical problems where the challenge was not only to build a model, but to understand the underlying workflow, evaluate different approaches, and turn successful ideas into reliable software.

In my recent AI engineering work, I fine-tuned Qwen models using QLoRA and built LLM-powered systems combining RAG, conversation memory, tool use, and multi-step agentic workflows. I have also worked with Python, FastAPI, REST APIs, Docker, MLflow, Git, CI/CD, cloud deployment, and model monitoring, giving me experience across the full lifecycle from experimentation to production.

What particularly attracts me to this role is the emphasis on solving real business problems rather than forcing AI into every workflow. I enjoy investigating ambiguous problems, understanding the data and operational constraints, and deciding whether the right solution is an LLM-based system, conventional software, automation, or a simpler process improvement.

My research background at CERN/ATLAS has also trained me to work rigorously with complex data, uncertainty, validation, reproducibility, and multidisciplinary teams. More recently, I have applied that same mindset to production-oriented AI systems, with a strong focus on reliability, evaluation, failure modes, and maintainable engineering.

I would be especially interested in helping build reusable AI engineering capabilities around model access, evaluation, observability, deployment, and CI/CD, while working directly with domain experts across renewable energy, trading, asset management, and operations.

I would be pleased to bring my experience in Python, applied AI, LLM systems, and scientific problem solving to your team.

Best regards,

Meisam Ghasemi Bostanabad
